Sequence 43, Application US/09855797A

Patent No. US20020094574A1

GENERAL INFORMATION:
APPLICANT: Bratley, James L.
APPLICANT: Temple, Gary F.
APPLICANT: Temple, Gary F.
APPLICANT: Temple, Gary F.
TITLE OF INVENTION: Recombination Sites
FILER REPERENCE: 0942.2850008

CURRENT APPLICATION NUMBER: US/09/855,797A

CURRENT APPLICATION NUMBER: US/09/855,797A

CURRENT FILING DATE: 1999-04-22

PRIOR PILING DATE: 1999-04-22

PRIOR FILING DATE: 1999-10-24

PRIOR FILING DATE: 1997-10-24

NUMBER OF SEQ ID NOS: 60

SOFTWARE: Patentin Ver. 2.0

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transgenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, ENNA, structural prodeins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, vaccines, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that provides an agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The cherencologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The cherencologous nucleic acid optionally encodes (YAC). This cherencosome (BAC) or a yeast artificial chromosome (YAC). This producing plant artificial chromosomes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 25 BP; 5 A; 4 C; 6 G; 10 T; 0 other;

Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,

Disclosure; Fig 24A; 357pp; English.

AAS06174-AAS06322 represent Bacteriophage lambda att recombination

ö att sequences are recognised by the recombination protein lambda integrates (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites with at least one target nucleic acid comprising one or more recombination sites and causing some or all of the nucleic acids to recombination sites and the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic acids which may be the same or different. The nucleic may also be used to express therapeutic proteins or peptides and they may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of Gaps and PCR primers of the invention. The 0: Length 27; Indels Score 23.4; DB 22; Pred. Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid -

Disclosure, Fig 13A; 273pp; English.

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population; (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. Sequences ABZSB727-762

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombinated and several sites that participate in recombinated and allowed the participate introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nucleic acid molecule into a platform a artificial chromosome, preferably an ACes. (II) is useful for producing a transgenic animal (e.g. a fish, insect, reptile, amphibian, arachnid, or mammal) by introducing (II) by cell fusion, lipid-mediated transfection by a carrier system, microinjection, microcall fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. ACC44612 to ACC44712 and ABP96650 to ABP96657 represent sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Plant artificial chromosome; PAC; transgenic plant; vaccine; blood factor; herbicide; stress; agronomical; nutrient quality; bacterial artificial chromosome; BAC; yeast artificial chromosome; YAC;

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting insertion of heterologous DNA into plant artificial chromosomes, methods for delivery of plant chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transpenic plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous nucleic acid encoding a gene product such as enzymes, antisense RNA, transpentic proteins, marker proteins, ligands, receptors, ribozymes, therapeutic proteins, and proteins, receptors, antibodies, blood factors, antigens, hormones, cytokines, growth factors, antibodies, or a product that provides for resistance to diseases, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that alters nutrient use and/or improves the nutrient quality of the plant. The cheterologous nucleic acid proteins and within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (CAC). This producing plant artificial chromosomes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Plant artificial chromosome; PAC; transgenic plant; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ü
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Perkins

```
The present introduction describes a vector, (i) compliably operatory introduction on a recipient cell, preferably in bacteria such as Escherichia coli; (i) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a promoter region capable of being recognized by RNA polymerases of a chimeric DNA construct comprising: (i) promoter or region capable of being recognized by RNA polymerases of a chird and fourth recombination sites; (iii) 3' transcription terminating and polyademylation region functional in the eukaryotic cell. The first and fourth recombination sites, or the second and third recombination sites, or sites are capable of reacting with a same recombination site, and corber or with a same recombination sites, or the third and fourth recombination sites, do not recombination sites, or the third and fourth recombination sites, do not recombination sites, or the third and fourth recombination sites. The vectors can also be used to producing large amounts of double-stranded RNA which can be used for silencing target nucleic acid sequences. The vectors can also be used to convent a DNA fragment into an invested repeat structure. Plants conventional breeding scheme to produce more plants with the same combination site attall which is given in the core sequence of recombination site attall which is given in the core exemplification of the present invention.
                                                                                                                                                                                        comprising operably linked
useful for silencing target nucleic acids and for producing large amounts of double-stranded RNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 25 BP; 5 A; 4 C; 6 G; 10 T; 0 other;

```
The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (I) a platform artificial chromosome expression system (ACes) (II) comprising several sites that participate in recombination; and (2) a method (MI) for introducing a heterologous nucleic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome. (I) can be used in gene therapy. (MI) is useful for chromosome, preferably an ACes. (II) is useful for producing a ratificial chromosome, preferably an ACes. (II) is useful for producing chromosome, microileic acid molecule into a platform of artificial chromosome, microileic acid molecule into an embryonic by a carrier system, microilection, microcell fusion, electroporation, microprojectile bombardment or direct DNA transfer into an embryonic microprojectile bombardment or direct DNA transfer into an embryonic cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for the codes at herapeutic product which is useful for the codes at the appeared product which is useful for the codes and AEPS of the AEPS of th

The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coll; (b) selectable marker region capable of being expressed in the recipient cell, and (c) a chimeric DNA construct comprising: (i) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerase; (ii) first, second third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and polyadenylation region functional in the eukaryotic cell. The first correspond or recombination sites, or the second and third recombination site, and preferably are identical. The first and second recombination site, and the third and fourth recombination site, and second recombination site, or the third and fourth recombination site, and second recombination site, or the third and fourth recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for silencing target nucleic acid sequences. The vectors can also be used to silencing target nucleic acid sequences. The vectors can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               sequence represents is given in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ABQ82128
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                              first expression cassette, comprising a first promoter operably linked to a nucleic acid sequence encoding a syncytium-inducing polypeptide (such as a fusogenic membrane glycoprotein) and flanked on either side by a comprising a tumour-specific promoter operably linked to a nucleic acid sequence encoding a recombinase, and/or a second expression cassette may be linked to a hypoxic response element (HRB), the second expression cassette may contain a promoter linked to a nucleic acid encoding a cytokine, and a third cassette may contain a tumour specific promoter linked to the nucleic acid encoding a cytokine, and a third cassette may contain a tumour specific promoter is, for example, a carcinoembryonic antigen (CEA) promoter or a tyrosinase promoter and the recombinase is, for example, cre recombinase or FLP recombinase. The invention is useful for reducing tumour size by administering the compositions as retroviral vectors, or in a cell containing the vector, to an individual in need of treatment for a disease caused by malignant cells. The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AACSTS66 to AACSTS81, sequences complementary to AACSTS81, or an RNA sequence corresponding to AACSTS66 to AACSTS81, an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site or avoids hairpin formation, the recombination site obeing an att or lox site; (2) an isolated nucleic acid molecule (III) comprising a first att recombination site comprising a mutation site of the comprising a mutation that above mentioned nucleic acids; (3) vectors (IV) comprising the above mentioned nucleic acids or (IV). The nucleic acids are used in conjuncating a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining engineered recombination in vitro or in vivo makes the methods for NNA or RNA subcloning, highly specific, rapid, and
                                                                                                                                                                                                                                                             Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Escherichia coli core region recombinant site attP2,P3 SEQ ID NO:16
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      93.6%; Score 23.4; DB 22; Length 25; 96.0%; Pred. The present invention describes an isolated nucleic acid molecule [1] comprising a first nucleic acid sequence having a defined sequence (AAC8786 to AAC87881, sequences complementary to AAC8786 to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881. Also described are: (1) an isolated nucleic acid molecule [II] comprising a first mutated recombination site that removes one or more stop codons from the recombination site that removes one or more stop codons from the being an act or lox site; (2) an isolated nucleic acid molecule [II] comprising a first act recombination site comprising a mutation that comprising a first act recombination site comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids or [IV]. The nucleic acids are used in considering a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids for obtaining engineered recombination in vitro or in vivo makes the above methods for DNA or RNA subcloning, highly specific, rapid, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        syncytium-inducing polypetide; fusogenic membrane glycoprotein; tumour; tecombinase; tumour-specific promoter; hypoxic response element; HRB; ss; tyrosinase promoter; FLP; retroviral vector; malignant cell; cancer; excisive recombination.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recombinant nucleic acid vector; carcinoembryonic antigen; CEA; cytokine;

The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors acch comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting gainst a host comprising the vectors conprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Escherichia coli core region recombinant site attR3 SEQ ID NO:11.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting galants a host comprising the vectors comprising the second vector, to clone the nucleic acid. The present sequence is a

The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMs) comprising: (a) combining in vitro or in vivo: (1) at least one insert donor molecules (IDMs) comprising one or more desired nucleic acid segments flanked by at least 2 comprising one recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMs) comprising at least 2 recombination sites which do not recombine with each other; and (3) one or sites which do not recombine with each other; and (3) one or more of the site specific recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the composition of the desired product molecules (PMs). The methods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that have the desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides that methods can also be used for changing vectors. The oligonucleotides that methods can also be used for the method of the invention.
                                                                                                                                                                                                                                                                                                                                             Sequence 25 BP; 5 A; 4 C; 6 G; 10 T; 0 other;

Methods for apposing nucleic acids comprising an expression signal ar a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under conditions for recombination

The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression spinal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxP site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site

partial gene in the presence of a recombination protein under conditions signal and the gene recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing rectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxP site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than brior att methods. The present sequence is a recombination site useful for recombination cloning.

(1) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMS) comprising at least 2 recombination sites which do not recombine with each other; add (3) one or more sites which control recombine with each other; and (3) one or more of transfer one or more of the desired segments into one or more of the VDMS, thereby producing no remore desired product molecules (PMS). The methods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that have the desired characteristics and/or nucleic acid segments. The have the desired for charging vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention.

AAT48210-25 are att recombination site core region DNA sequences. The core region has at least one engineered mutation that enhances recombination in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donor DNA molecules. The nucleic acids, vectors and methods of the invention are engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or modification of transcribed, replicated, isolated or genomic DNA or

The present invention describes a vector (I) comprising operably linked DNA fragments having: (a) origin of replication allowing replication in a recipient cell, preferably in bacteria such as Escherichia coli; (b) selectable marker region capable of being expressed in the recipient cell; and (c) a chimeric DNA construct comprising: (I) promoter or promoter region capable of being recognized by RNA polymerases of a cukaryotic cell or by prokaryotic RNA polymerases (ii) first, second, third and fourth recombination sites; (iii) 3' transcription terminating and polyadenylation region functional in the eukaryotic cell. The first and fourth recombination sites, (iii) 3' transcription termination sites are capable of reacting with a same recombination site, and preferably are identical. The first and second recombination sites, or the third and fourth recombination sites, do not recombine with each the third and fourth recombination site. The vector is useful for producing large amounts of double-stranded RNA which can be used for allending target nucleic acid sequences. The vectors can also be used to convent a DNA fragment tinto an inverted repeat structure. Plants transformed with a vector from the present invention can be used in a conventional breeding scheme to polyade more plants with the same conventions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ion of nucleic acids. The present sequence represents nucleotide sequence from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 18691 BP; 4837 A; 4621 C; 4607 G; 4626 T; 0 other;

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, and attB2 mulecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising a second recombination site and a second mucleic acid molecule comprising a second recombination site that interacts with the mutated comprising a second recombination site that interacts with the mutated comprising a second recombination site that interacts and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from
                                                                                                                                                                                                               ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population, (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. The present sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the secon population of nucleic acid with a second target nucleic acid -
proteins, operably linking nucleic acid molecules of interest
            regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning. (1), (II), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                         Gaps

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attB1, attB2, attL1, attL2, attB1, attB2 chocoding an attB1 attB2, attB1, attB2, attL1, attL2, attB1, and attB2 chocitde sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination sites and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising a second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site. (I), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from
                                                                                                                                                                                                                                                                                                                                                                                                                   ö
of nucleic acid with a second target nucleic acid; and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. The present sequence represents the destination plasmid pDONR201 nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   attP2,

Isolated nucleic acid molecules encoding an attB1, attB2, attP1, attL1, attL1, attL2, attR1 nucleotide sequence useful for the recombinational cloning of polypeptides -

Example 9; Fig 49; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attL1, attR2, attR1, and attR2

mucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising at least one mutation in its core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated nucleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising the mutated att recombination site and a second nucleic acid molecule comprising the comprising a second recombination site and a second nucleic acid molecule att recombination site. (I), (III), primers, vectors and methods from the present invention are used for the recombinational cloning of mucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from desired proteins, operably linking nucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, regulatory genetic sequences. changing copy number, changing replicons, cloning into phages and cloning. (1), (II), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention. 99999999999999999999<del>8</del>8

Inserting a population of nucleic acids into a second target molecule for selecting and isolating nucleic acid molecules by mixing the second population of nucleic acid with a second target nucleic acid.

Disclosure, Fig 26B-C; 273pp; English.

The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid; (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of molecules to form a second population; (c) mixing the second population

```
molecule (II) comprising one or more att recombination sites comprising molecule (II) comprising one or more att recombination sites comprising of interaction mitters core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated muleic acid molecule (III) comprising one or more mutated att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising a second recombination site and a second muleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site and a second molecule comprising a second recombination site that interacts with the mutated att recombination site and second molecule comprising of the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from desired proteins, operably linking mucleic acid molecules of interest to regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning into the present invention.

Coloning: (III), (III), host cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is

```
nucleotide sequence. Also described are: (1) an isolated nucleic acid molecule (II) comprising one or more att recombination sites comprising of interaction minits core region that increases the specificity of interaction between the recombination site and a second att recombination site; and (2) an isolated mucleic acid molecule (III) comprising one or more muttad att recombination sites comprising at least one mutation in its core region that enhances the efficiency of recombination between a first nucleic acid molecule comprising a second recombination site and a second nucleic acid molecule comprising a second recombination site that interacts with the mutated att recombination site and a second nucleic acid molecule comprising a second recombination site and second nucleic acid molecule of trom the present invention are used for the recombinational cloning of nucleic acid molecules. They can be used for changing vectors, targeting gene products to intracellular locations, cleaving fusion tags from regulatory genetic sequences, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages and cloning (I), (III), (III), how cells and vectors can be used in the production of polypeptides and antibodies. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacteriophage lambda; att; recombination site; attB; attB; attL; attL; mutant; recombinational cloning; entry vector; destination vector; gene product targeting; fusion tag cleavage; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                              The invention relates to inserting a population of nucleic acids into a second target molecule. The method involves (a) mixing a first population of nucleic acid comprising one or more recombination sites with a target nucleic acid, (b) causing some or all of the nucleic acid molecules of the first population to recombine with the first target nucleic acid molecules of nucleic acid with a second population, (c) mixing the second population of nucleic acid with a second target nucleic acid, and (d) causing some or all of the nucleic acid molecules of the second population to recombine with some or all of the second target nucleic acid molecules to form a third population of nucleic acid. The method is useful for selecting and isolating nucleic acid molecules. Sequences ABZS8727-762 represent att recombination site sequences used in the method of the

Isolated nucleic acid molecules encoding an attB1, attB2, attL1, attL2, attR1, and attR2 nucleotide sequence useful recombinational cloning of polypeptides -

Example 9; Fig 52; 459pp; English.

The present invention describes isolated nucleic acid molecules (I) encoding an attB1, attB2, attP1, attP2, attL1, attR2

The invention relates to a novel method for producing plant artificial chromosomes. The invention also relates to methods for targeting chromosomes. The invention also relates to methods for targeting cinsertion of heterologous DNA into plant artificial chromosomes to selected cells and tissues. The isolated plant artificial chromosome (PAC) is useful for producing a transported plant, which involves introducing the PAC into a plant cell. The PAC comprises a heterologous mucleic acid encoding a gene product such as enzymes, antisense RNA, tRNA, structural proteins, marker proteins, lagands, receptors, ribozymes, therapeutic proteins, marker biopharmaceutical proteins, rationes, or a product that provides for cesistance to disease, insects, herbicides, or stress in a plant. The heterologous nucleic acid optionally encodes a product that alters heterologous nucleic acid optionally encodes a product that alters agronomically important trait in the plant, e.g. a product that alters nutrient use and/or improves the nutrient quality of the plant. The heterologous nucleic acid is contained within a bacterial artificial chromosome (BAC) or a yeast artificial chromosome (MAC). This proved the method for a product and an oligo relating to the method for a product and a product chart alters are allowed the artificial chromosome (MAC). This
                                                                                                                                                                                                                                                                 Producing artificial chromosome by introducing a nucleic acid into plant cell, selecting artificial chromosome that has one or more repeat regions with equivalent amounts of euchromatic and heterochromatic nucleic acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Bacteriophage lambda; recombination; att Bite; PCR primer; lambda Int;

AASO6174-AASO6322 represent Bacteriophage lambda att recombination att enducies acid sequences, and PCR primers of the invention. The att sequences are recognised by the recombination protein lambda integrase (Int). The invention is a new method of producing a population of hybrid nucleic acids comprising mixing at least a first population of hybrid nucleic acids comprising mixing at least a first population of nucleic acids comprising one or more recombination sites and causing some or all of the nucleic acids to recombine with all or some of the target nucleic acids. The method is useful for producing a population of hybrid nucleic acids which may be the same or different. The nucleic may also be used to express therapeutic proteins or peptides and they may also be used to create novel fusion proteins by expressing different sequences linked to each other. The method allows simultaneous cloning of two or more different nucleic acids.
                                                                                                                                                                                             Producing hybrid nucleic acids, useful for expressing novel therapeutic polypeptides, by mixing the same or different nucleic acids having one or more recombination sites in the presence of recombination proteins,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention describes a vector (I) comprising operably linked

The present call, preferably in bacteria such as Bacherichia coli;

(b) selectable marker region capable of being expressed in the recipient

(c) selectable marker region capable of being expressed in the recipient

CC promoter region capable of being recognized by RNA polymerases of a

cell; and (c) a chimeric DNA construct comprising; (i) promoter or

CC promoter region capable of being recognized by RNA polymerases of a

cell; and fourth recombination sites; (ii) 3' transcription terminating

and polyadenylation region functional in the ewkaryotic cell. The first

and fourth recombination sites; (iii) 3' transcription termination

CC preferably are identical. The first and second and third recombination

CC preferably are identical. The first and second recombination sites, and

CC the third and fourth recombination sites, do not recombine with each

CC ther or with a same recombination site. The vector is useful for

CC producing large amounts of double-stranded RNA which can be used to

CC convert a DNA fragment into an inverted repeat structure. Plants

CC convert a DNA fragment three present invention can be used in a

The present invention describes a eukaryotic chromosome (I) comprising one or several att sites, where an att site is heterologous to the chromosome, and permits site-directed integration in the presence of lambda-integrase. Also described: (1) a platform artificial chromosome expression system (Aces) (II) comprising several sites that participate in recombinase catalysed recombination; and (2) a method (MI) for introducing a heterologous nuclaic acid into a platform artificial chromosome. (I) can be used in gene therapy. (MI) is useful for introducing a heterologous nuclaic acid molecule into a platform artificial chromosome, preferably an Aces. (II) is useful for producing a transfencing (II) by cell fusion, lipid-mediated transfection by a carrier system, microaniscial into an embryonic microprojectile bombardment or direct DNA transfer into an embryonic chromosome. ö cell, preferably a stem cell or an embryo. (II) comprises a heterologous nucleic acid that encodes a therapeutic product which is useful for making a library of ACes comprising random portions of a genome. The present invention describes an isolated nucleic acid molecule (I) comprising a first nucleic acid sequence having a defined sequence (AAC87866 to AAC87881, sequences complementary to AAC87881, or an RNA sequence corresponding to AAC87866 to AAC87881.

To are: (1) an isolated nucleic acid molecule (II) comprising a first mutated recombination site that removes one or more stop codons from the recombination site that removes one or more actor adons from the being an att or lox site; (2) an isolated nucleic acid molecule (III) comprising a first att recombination site omprising a mutation that enhances recombination specificity; (3) vectors (IV) comprising the above mentioned nucleic acids; and (4) cells comprising the above mentioned nucleic acids; and (4) cells comprising the above mutative sites suitable for subcloning reactions. The use of nucleic acids or (IV). The nucleic acids are used in engineering a core region of a given recombination site to provide mutative sites suitable for subcloning reactions. The use of nucleic acids and the methods for DNA or RNA subcloning, highly specific, rapid, and less labour intensive.
                                                                                                                                                                                                                                                                                                                                                             Isolated nucleic acid molecules comprising a DNA segment having two engineered recombination sites, derived from att or lox, which flank a selectable marker and comprise a core region having an engineered
                 Core region, recombination site, cloning, chimeric DNA, characteristic, mutation, att site, lox site, ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 GITCAGCITITIGIACAAAGIIGG 25

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to a method for in vitro cloning of a nucleic acid of interest. The method involves mixing in vitro two vectors each comprising at least one recombination site and the nucleic acid of interest; incubating the mixture in the presence of at least one recombination protein to result in recombination of the recombination sites, leading to production of a chimeric nucleic acid molecule comprising the nucleic acid of interest; contacting hosts with the mixture; and selecting for a host comprising the chimeric nucleic acid molecule, and selecting for a host comprising the vectors comprising the second vector; to clone the nucleic acid. The present sequence is a recombinantion site, which may be used in the method of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          In vitro cloning of nucleic acid involves mixing vectors comprising recombination sites and/or nucleic acid, incubating mixture to produce chimeric molecule, contacting hosts with mixture and selecting host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Escherichia coli core region recombinant site attP1 SEQ ID NO:15.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ;

The invention relates to novel methods for cloning or subcloning one or more nucleic acid molecules (NAMS) comprising: (a) combining in vitro or in vivo: (1) at least one insert donor molecules (IDMS) comprising one or more desired nucleic acid segments flanked by at least 2 recombination sites which do not recombine with each other; (2) one or more vector donor molecules (VDMS) comprising at least 2 recombination sites which do not recombine with each other; and (3) one or sites specific recombination proteins; (b) incubating the combination to transfer one or more of the desired segments into one or more of the VDMs, thereby producing one or more desired product molecules (PMS). The methods can be used for the efficient and specific recombination of NAM segments. They can be used to generate chimeric DNA or RNA molecules that
                                                                  AAT48210-25 are att recombination site core region DNA sequences. The recombination in the formation of a Cointegrate or Product DNA. These core regions can be incorporated into novel vector donor DNA molecules. The nucleic acids, vectors and methods of the invention are used to obtain chimeric nucleic acid using recombination proteins and engineered recombination sites in vitro or in vivo. The improved specificity, speed and yields of the invention facilitates DNA or RNA subcloning, regulation or exchange useful for any related purpose, e.g. in vitro recombination of DNA segments, and in vitro or in vivo insertion or modification of transcribed, replicated, isolated or genomic DNA or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cloning; donor; recombination site; vector; chimeric; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for apposing an expression signal and a gene or partial gene, using recombinatorial cloning. The method incubates nucleic acids comprising the expression signal and the gene/partial gene in the presence of a recombination protein under conditions sufficient to cause recombination and therefore appose the expression signal and the gene or partial gene. The methods are useful for apposing an expression signal and a gene or partial gene using recombinatorial cloning. The methods are also useful for changing vectors, constructing genes for fusion proteins, changing copy number, changing replicons, cloning into phages, and cloning e.g., PCR products (with an attB site at one end and a loxP site at the other end), genomic DNAs, and cDNAs. The methods are highly specific, rapid, and less labour intensive than prior art methods. The present sequence is a recombination site useful for recombination cloning.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Methods for apposing nucleic acids comprising an expression signal and a gene/partial gene, using recombinatorial cloning by incubating the nucleic acids in the presence of a recombination protein under
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                   Gaps
have the desired characteristics and/or nucleic acid segments. The methods can also be used for changing vectors. The oligonucleotides AAX78935-X78994 are used in the method of the invention.
